TO WHOM IT MAY CONCERN

Re: Letter of Recommendation for Kavish Chapra

Some students complete physics problems efficiently. Kavish Chapra stayed behind to understand why the solution worked in the first place. I taught Kavish A-Level Physics over the course of one and a half years, and this habit of questioning assumptions and checking conclusions defined his approach to learning throughout that time.

In my classroom, Kavish's work was consistently thorough, well organized, and carefully reasoned. He completed all assigned tasks on time and with attention to detail, and I could rely on the quality of his work without needing to prompt him. His written solutions showed clear structure, correct use of notation, and careful handling of units and limiting cases. When grading his work, it was clear that he preferred to understand the underlying ideas before applying formulas. Although Kavish intends to study Economics, the way he works in Physics shows the kind of quantitative thinking needed for success in that field. He participated actively in class, asking focused questions and contributing to discussion in a way that helped move lessons forward when the class reached more difficult points.

Practical laboratory work was an important part of our A-Level Physics course, and Kavish approached it with interest and care. During experiments, he paid close attention to how theoretical ideas appeared in practical results and often asked sensible questions about possible sources of error, the set-up of the experiment, and why results did not always match what was expected. I frequently spent time at his bench discussing how the experiment could be improved or how the results should be interpreted, and these discussions showed his ability to think carefully about both theory and practice.

Kavish interacted with the classroom environment in a constructive and engaged way. He worked well independently and in group settings, and he was trusted by both peers and teachers. When other students struggled, I frequently asked Kavish to help explain a concept or walk through a line of reasoning. He did so patiently and clearly, focusing on why each step made sense, and his classmates were comfortable seeking his help. In problem-solving work, Kavish demonstrated strong intellectual discipline. He defined variables carefully, checked units, evaluated limiting cases, and paid close attention to the assumptions underlying each model. On several occasions, he questioned whether commonly used approximations were appropriate for a given situation and adjusted his

approach accordingly. He responded well to feedback and used it to improve his understanding rather than simply correct errors.

What I will remember most about Kavish is his consistency. His curiosity was steady, and his work ethic did not waver when problems became challenging. He took responsibility for his own learning and approached tasks with honesty and care. In comparative terms, Kavish stands among the strongest students I have taught in recent years. He is firmly in the top tier for quantitative reasoning and analytical depth. His strength lies in the clarity of his thinking and the reliability with which he applies it.

I am confident that Kavish will bring careful reasoning, intellectual integrity, and a collaborative approach to any academic environment. He carries my strongest recommendation.

Sincerely,

Dr. Chan Pei Yi
Former Physics Lecturer, Methodist College Kuala Lumpur (Malaysia)
Lecturer, Sunway College
